

# Gallimimus's leather cap

In this world, dinosaurs survived the asteroid and its aftermath, flourished alongside human. Human's relationship with dinosaurs is complicated. Big carnivorous dinosaurs--depending on the country--either get tamed or is on the verge of extinction due to loss of habitats. Herbivorous dinosaurs either get domesticated or face the same problem due to loss of habitats.

The artifact I propose for this world is a leather cap for the Gallimimus. Gallimimus(es) were, and still are thought to be ancestor of today's chicken, albeit their sizes are much larger than chicken, enough to carry a grown human on their back. The leather cap (or other materials) would be used to calm them down when they're resting, similar use to eagle's leather cap in our world in training eagle.

## Gallimimus's Ankle Lock

Another artifact could potential be the ankle lock. In this world, dinosaurs like Gallimimus are used as vehicle, therefore there are a market for tools to control and protect ownership, such as these ankle locks. They are made using the technology of electromagnet--they can be triggered on/off using a remote that control the discharge of electric through the locks; they are usually used to control the behavior of the dinosaur.
